Anatomy *of a* Research Paper

Beyond writing—understanding the architecture of a publication-ready manuscript.

> Every published paper tells two stories: the science you **discovered**, and the science your readers **understood**.

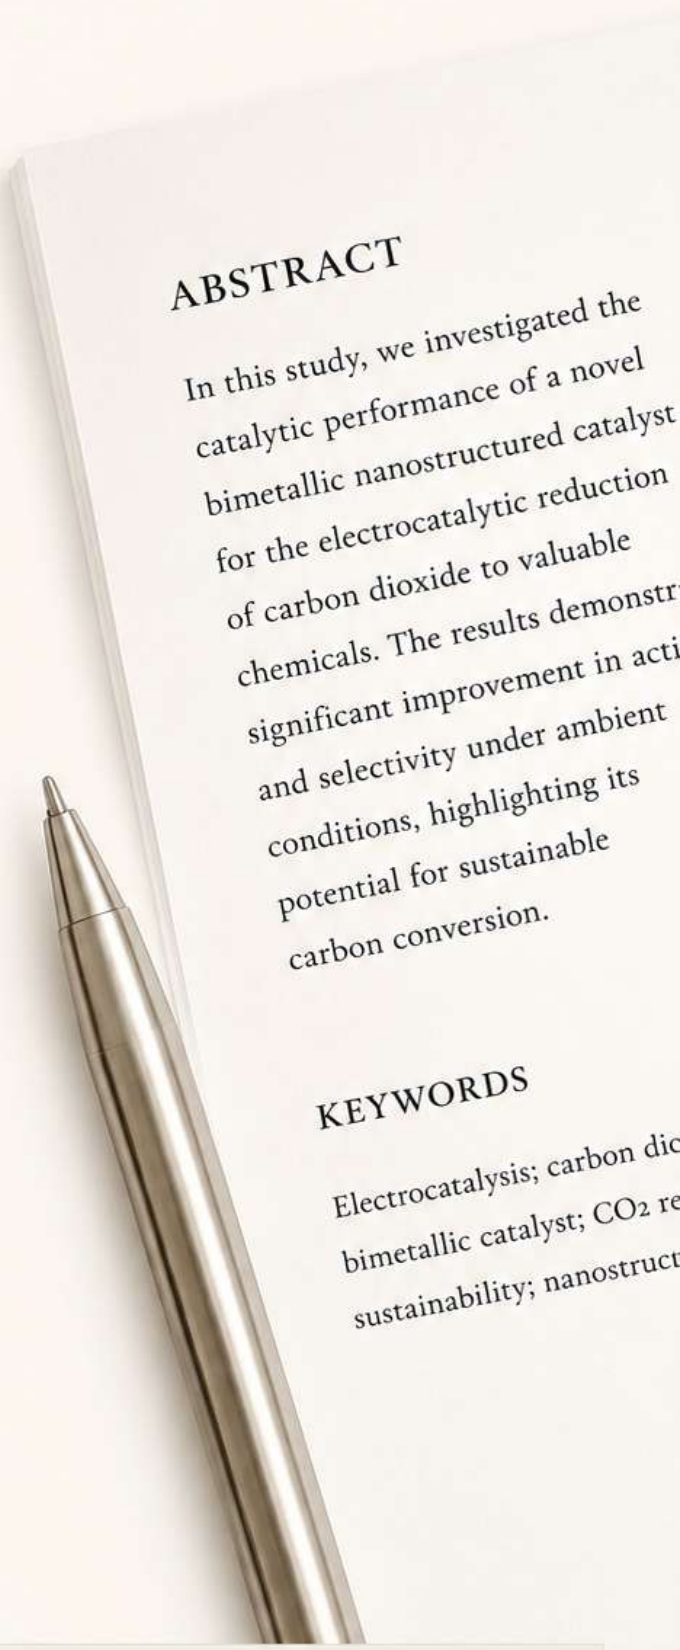

This carousel explores how to bridge the gap.

A practical guide for **researchers**, **PhD scholars** & **early-career scientists**.

Leo Writes Consulting
Where Research Finds Its Voice.

02

First Impressions Matter

A REVIEWER FIRST SEES:

Title
Should be precise, informative, and reflect the core of your study.

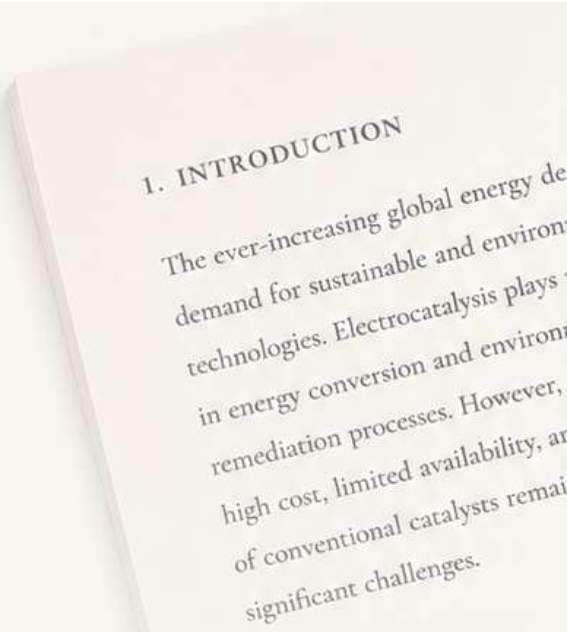

Abstract
A concise summary of background, methods, key results, and significance.

Keywords
Choose terms that accurately represent your work and enhance discoverability.

These elements shape whether readers **continue reading** or move on.

ASK YOURSELF

Can a reviewer understand the **essence and relevance** of my work from these three elements alone?

Tell a Logical Scientific Story

YOUR MANUSCRIPT SHOULD ANSWER:

Introduction
Why was this study needed?

Establish the context, identify the gap in knowledge, and define the objective or hypothesis.

Methods
What exactly was done?

Provide sufficient detail and clarity to ensure reproducibility and scientific rigor.

Results
What was discovered?

Present data objectively and clearly, using figures and tables that communicate the findings.

Discussion
Why do these findings matter?

Interpret results, explain their significance, address limitations, and connect to the broader literature.

> A strong manuscript flows seamlessly from question to contribution.

Good Research Isn't Enough

Many manuscripts are declined or return with major revisions not because of weak science, but because of weak communication.

COMMON MANUSCRIPT PITFALLS

Weak Structure
Sections are disconnected, objectives are unclear, or the narrative lacks coherence.

Unclear Writing
Ambiguous sentences, jargon overload, and vague statements obscure meaning.

Poor Flow Between Sections
Ideas are repeated, transitions are missing, and the story becomes hard to follow.

Unsupported Claims
Conclusions are not fully backed by data or appropriate analysis.

Inadequate Context
Insufficient literature integration or missing rationale reduces the impact of the work.

> Reviewers evaluate not only the science, but also how clearly and rigorously it is communicated.

Before You Submit

A FINAL QUALITY CHECK

- **Scientific Rigor**
  Are the methods appropriate, replicable, and reported with sufficient detail?
- **Logical Coherence**
  Does the narrative flow logically from the research question to the conclusions?
- **Data Integrity**
  Are the results presented accurately, with proper statistics and clear visualizations?
- **Context and Contribution**
  Is the significance clear and the study positioned within the existing literature?
- **Language and Clarity**
  Is the writing precise, concise, and free from ambiguity?
- **Journal Readiness**
  Does the manuscript follow the target journal's scope, format, and ethical guidelines?
- **Overall Impact**
  Will the reader understand the value and relevance of your work in one sitting?

> "Great research deserves to be understood.
>
> Thoughtful writing makes it possible."

A well-crafted manuscript is not just seen—
it is remembered, cited, and built upon.
