Every AI demo works great... Until it hits real data.

Your AI may be smart.
Your data layer still isn't wired to it.

Oracle collapses the gap between AI and your data

3 capabilities that change the stack

★ One integrated data-aware AI stack. ★

The stack, end to end

No surprises. Just the full picture.

Runs locally for free.
Scales on OCI when you're ready.

Project 1: Hybrid Analyst

NL2SQL + Doc-RAG in one agent

Question: What were Q1 sales?

Question: What counts as a closed deal?

Routes to
SQL or RAG
automatically

Live DB
access with
MCP Server

Policy docs
stored in
OracleVS

Memory
keeps context
per user

**HYBRID
ANALYST
AGENT** ✨

SQL
ROUTE

SQL via
MCP Server
Run queries.
Get results.

DOC-RAG
ROUTE

Policy docs
in OracleVS
Search docs.
Find answers.

Unified Answer
Combines data + policy
for the user.

Per-user memory
via OAMP
Remembers context,
preferences, history.

One analyst agent that knows
your **business** and your **database**.

Project 2: Self-Improving Research Agent

It learns from past tool calls

Each tool call becomes searchable memory

Similarity search finds related failures

The next action improves from experience

Simple agent memory.
Practical enough for production.

Project 3: Conversational Schema Designer

Turn a conversation into a working database

Understands requirements in plain language

Generates a first-draft schema fast

Asks for confirmation before database changes

No senior DBA required
for the first draft.

Why this matters now

AI apps are hitting the real-data wall

①

The next wave
won't be won by
model quality alone

②

It will be won by
how well AI connects
to real enterprise data

③

Oracle 23ai is
built for that
moment

✨ The future of AI apps is not just smarter models.
It's smarter data integration.

Who should build with this?

This stack fits teams that need data-aware AI

- ✓ You're building AI on top of enterprise data
- ✓ You're tired of running a separate vector database
- ✓ You want agents with real memory, not just session state
- ✓ You need your LLM to act on the database, not just read chunks

If your AI has to work with real systems,
this stack is built for you.

The demo-to-product gap is a data problem.

Oracle is built to close it.

Build with **live data**.
Add **memory**.
Turn demos into **products**.
