

AI Catches the Fraudster

Before You Do.

How AI is transforming fraud detection —
from suspicious signals to real-time alerts.

Fraud Hides in the Gaps

Humans Can't See.

- **Millions of daily transactions**

Manual review covers less than 1% — fraud slips through the rest.

- **Fraud moves faster than reports**

By the time a file is reviewed, the money is already gone.

- **Collusion across entities**

Pattern-based fraud needs cross-entity analysis no team can do manually.

What AI Actually Does in *Fraud Detection*:

- **Flags anomalies in real time**

Transactions deviating from baseline — caught instantly, not next month.

- **Connects unrelated entities**

Links suppliers, invoices & payments no human would ever cross-reference.

- **Risk scores every record**

Every vendor, deal & payment gets a live risk score — not a quarterly audit.

- **Screens against watchlists**

AML & sanctions checks run automatically on every new counterparty.

Where I Use This *In My Own Work:*

- **Duplicate commission detection**

AI flags the same deal submitted twice by different agents — before payment.

- **Sanctioned developer screening**

Every new developer auto-checked against AML watchlists via n8n.

- **Expense outlier alerts**

Unusual Pemo card spend flagged before month-end close.

- **Round-number detection**

A classic fraud signal — AI catches what humans overlook in bulk data.

The Fraud Was Always There.

Now Someone Is Watching.

AI doesn't replace the financial analyst.
It gives them eyes that never close.

Which fraud signal worries you most?
