EDUCATIONAL · AI ENGINEERING

The AI skill **nobody** is teaching you.

Prompting an LLM gets you a demo.

Evals get you a product that survives real users, real edge cases, and 3am inputs you never imagined.

So what's **an eval**?

A normal test is easy. The answer never moves:

NORMAL TEST

$2 + 2 \rightarrow 4$

One exact answer. Same every single time.

AN LLM

same prompt $\rightarrow$
different answers

Exact-match testing breaks instantly.

An **eval** scores the output against what **"good"** looks like, across dozens of real examples, automatically. A unit-test suite for behavior you can't fully predict.

3

WHY IT MATTERS

You can't ship AI without them.

WITHOUT EVALS

Every prompt tweak is a guess. Fix one case, silently break three others. You find out when a user does.

WITH EVALS

Change the prompt, run 50 cases in seconds, and see exactly what improved and what regressed.

The whole gap between **"it worked when I tried it"** and **"it works at scale."**

4

FROM EXPERIENCE

Vibes don't **scale**.

I watched a team burn two weeks tuning prompts by feel.
Ship it, break it, ship it again.

The fix wasn't a smarter prompt. It was **20 test cases written down first**, so every change had a scoreboard instead of an opinion.

The moment you can **measure "better,"** AI stops being magic you pray to and becomes software you engineer.

5

YOUR TURN

Most can prompt. Few can prove it works.

What AI skill do you think becomes **essential** for software engineers over the next **2-3 years**?
