

AI WORKFLOW

STOP PROMPTING

START LOOPING

The job isn't writing prompts anymore. It's designing the loop that writes them — and it changes what you actually do.

A PROMPT VS A LOOP

A prompt is a single move — and **you're the bottleneck**. A loop is a system that judges and repeats itself.

PROMPT

Ask, read, judge, ask again

You stay in active control

Every pass waits on you

You are the operator

LOOP

Generate, score, refine, stop

Runs the judgment itself

Iterates while you're away

You are the designer

EVERY LOOP HAS THREE PARTS

Strip any working loop down and you find the same three pieces. Miss one and you just generate noise.

OBJECTIVE — what "done" actually looks like. Concrete, never vague.

METRIC — how it judges a pass without you reviewing it.

BOUNDARY — when it stops, or when it escalates to a human.

WHAT A LOOP ACTUALLY IS

Try, check, fix, repeat — against a target. The model stops guessing once and hoping.

LOOP.PY

```
# objective + metric + boundary
draft = generate(task)

while score(draft) < threshold:
    draft = refine(draft, feedback)

    if passes > max_passes:
        escalate_to_human()
        break
```

A REAL LOOP: COLD EMAIL

A first-touch email a busy office manager would actually reply to — defined as a loop, not a prompt.

PART		HOW IT'S SET	
Objective		Reply-worthy email, under 90 words	
Metric		Score 1–10: one specific line, one ask	
Boundary		Rewrite anything under 8, max 3 passes	
Fuel		Feed in real winning emails as examples	

THE TRAP THAT KILLS **LOOPS**

When a model grades its own work on vague criteria like "taste," it just reoptimizes **polish**. The score climbs. The output doesn't.

THE DISHONEST-METRIC PROBLEM

Wire the loop to a real, external signal — actual reply rates, real engagement. Self-assigned scores only ever produce confident mediocrity.

PULKIT TYAGI

ASK THREE QS BEFORE YOU **BUILD**

The typing disappears. The thinking moves upstream and gets harder.
Answer these first:

DONE WELL? — what does a great result actually look like here?

SELF-CHECK? — how would it know a pass improved, without you?

STOP WHERE? — where must it pause for human judgment?

PICK ONE TASK YOU KEEP

PROMPTING BY HAND

This week, don't prompt it again. Write the loop: objective, metric, stop condition. Let it run — then tell me what broke first.
