AI PM **Mistakes** I Wish I Avoided Earlier

Hard-earned lessons from building **AI** products.

Let's learn together

LESSONS

STEP 1

1

I Trusted the Demo Too Much

- Demo success $\neq$ production success
- Happy-path prompts hide real problems
- Test with messy, real user behavior

TRUST

STEP 2

2

I Underestimated **Evals**

- Accuracy alone isn't enough
- **Measure** consistency
- **Measure** refusals
- **Measure** real user outcomes

EVALUATE

STEP 3

3

Accuracy Was Never the Whole Story

- Fast matters
- Cost matters
- **Trust** matters
- Recovery matters

CONTEXT

Users judge the **experience**, not the benchmark.

STEP 4

4

I Ignored **Failure** Modes

Every AI product eventually will:

- ❗ **hallucinate**
- ✕ **refuse**
- ❓ **misunderstand**
- ⌚ **timeout**

Your product should know what happens **next**.

FAILURES

STEP 5

5

I Underestimated the Human Layer

Humans shouldn't disappear. They should appear at the **right moment**.

 review flows

✓ approvals

↑ escalation

 **feedback** loops

HUMAN

AI Products Need Guardrails, Not Guesswork

Great AI products don't chase perfect accuracy.
They build:

- ✓ evaluation
- ✓ observability
- ✓ guardrails
- ✓ human oversight

That's what
earns **trust**.
