GPT-LIVE IS HERE

VOICE AI STOPS TAKING TURNS

OpenAI's new full-duplex voice models listen and speak at the same time — and every "wait for silence" interface just became legacy.

WHAT OPENAI JUST SHIPPED

On July 8, 2026, OpenAI released **GPT-Live** — a new generation of voice models now powering ChatGPT Voice, rolling out globally with multi-language support.

PLATFORMS AT
LAUNCH

GPT-Live-1 is the default for paid ChatGPT plans; **GPT-Live-1-mini** powers the free tier. Both ship on iOS, Android, and web — and Live-1's 75.5 on OpenAI's conversational-pleasantness eval leaves the old voice model far behind.

THE END OF TAKING TURNS

Every voice assistant until now was **half-duplex** — a walkie-talkie. GPT-Live's full-duplex architecture processes your audio **while generating its own speech**.

TURN-BASED (OLD)

Waits for silence before responding

Interruptions reset the pipeline

Pauses read as "your turn"

Background noise derails it

FULL-DUPLEX (LIVE)

Listens and speaks simultaneously

Quick back-and-forth works

Waits while you think

Locks onto your voice

The pause is no longer the protocol.

Senior Gen-AI Engineer

IT BEHAVES LIKE A LISTENER

Full-duplex isn't just lower latency — it changes **conversational behavior**. Silence is now a feature, not a timeout.

-  Back-channels with "mhmm" or "yeah" while you talk — it shows it's paying attention
-  Waits instead of jumping in when you pause to think mid-sentence
-  Stays quiet when you ask it to just listen
-  Focuses on your voice instead of passing traffic or nearby conversations

THE FRONTIER HANDOFF

GPT-Live doesn't try to do everything itself. Hard questions get **delegated to GPT-5.5** behind the scenes — while the conversation keeps flowing.

YOU ASK	WHAT HAPPENS
Quick chat	GPT-Live-1 answers instantly, in-stream
Web search	Delegated to the frontier model behind the scenes
Deep reasoning	GPT-5.5 works on it in the background
Meanwhile	GPT-Live keeps talking, then weaves the result back in

It's a **real-time orchestrator** with a frontier brain on call.

VOICE GETS A SCREEN

GPT-Live surfaces **rich visual cards** during voice conversations — you glance at data instead of hearing a paragraph of numbers read aloud.

Weather forecasts appear as cards mid-conversation

Stock data renders as glanceable visuals

Sports scores show up without breaking the flow of speech

Maps display while the conversation keeps going

Voice stops being audio-only and becomes a **multimodal surface**.

WHO GETS IT, AND WHEN

Rolling out now in ChatGPT. For builders, the API is **"coming soon"** — OpenAI is taking interest registrations, not giving dates.

TIER	WHAT YOU GET
Paid plans	GPT-Live-1 as the default voice model
Free tier	GPT-Live-1-mini, same full-duplex design
Platforms	iOS, Android, and web — multiple languages
Developers	API coming soon; register interest now

If your voice stack assumes **"detect silence, then respond"** — start redesigning for interruptions and mid-stream delegation today.

**WHAT WOULD YOU BUILD
ON A MODEL THAT LISTENS
WHILE IT TALKS?**
