Why your **AI SDR** gets dumber over time

If nobody's maintaining the graph underneath it

04 · WHAT DECAY LOOKS LIKE

Nothing **bounces** at first. Everything gets a little **wrong**.

Stale contact & account resolution doesn't announce itself with an error. It shows up as a slow accumulation of small, defensible-looking sends, each one easy to miss, all of them compounding toward your domain's reputation.

↳ Elapsed	↳ What's happening in the graph	↳ What the agent does
▶ Week 1	A new list import introduces a duplicate contact that was never merged.	Sends two different cold emails to the same person, from two threads.
▶ Month 1	Job changes and title drift go unresolved as more lists merge in.	Personalizes on the wrong title, company, or role, and gets ignored.
▶ Month 6	Stale and duplicate contacts outnumber clean ones; match confidence drops.	Bounce & complaint rates climb; domain reputation starts to slip.
▶ Year 1+	Nobody trusts the list hygiene enough to expand who the agent can reach.	Gets fenced off to a smaller, "safe" segment instead of full TAM.

05 · MECHANISM

One bad match, four places it costs you.

An unresolved contact doesn't stay contained to the graph. It travels downstream through every layer an outbound agent depends on, all the way to the send.

Today · 06:18 PMEdit

06 · SOLUTION

The fix isn't a bigger list. It's a maintenance flywheel.

A GTM graph that stays accurate isn't the output of a one-time cleanup, it's the output of a loop that never stops running. The flywheel below is that loop: five recurring steps, each one feeding the next, each one owned by someone rather than assumed to happen on its own.

Run continuously, it turns contact & account resolution from a launch-day task into a standing capability, **one that keeps every cold email your agent sends as sharp on day 500 as it was on day one.**

Monitor. Detect. Resolve. Reconcile. Publish. Repeat.

07 · THE FIVE STEPS

Step 01 • Monitor

Track match confidence & list freshness across CRM, enrichment vendors, and intent data so drift shows up before a contact gets emailed.

Step 01 • Detect

Surface new duplicate contacts, orphaned leads, and broken company-to-account links, ranked by which campaigns they'd touch.

Step 01 • Resolve

Re-run matching with current rules against the flagged set, with a human review path for anything below confidence threshold before the next send.

Step 01 • Reconcile

Merge, split, and re-link contacts & accounts in place, keeping a clear record of every change so it can be traced & reversed.

Step 01 • Publish

Push the reconciled list to every sequence & outbound agent reading from it, on a cadence not whenever someone remembers to.

Step 01 • Back to Monitor

The next source, the next merge, the next drift starts the loop again. That repetition is the point.

08 · THE DIFFERENCE

What "maintained" actually buys your outbound.

	UNMAINTAINED GRAPH	GRAPH ON THE FLYWHEEL
Contact & account accuracy	Degrades silently after launch	Holds steady as new lists arrive
Outbound behavior	Duplicate sends, wrong personalization	Deduplicated, correctly personalized
Reputation risk	Discovered as bounces & complaints	Caught before the send goes out
Scope of trust	Agent fenced off to a small "safe" list	Expands to new segments as confidence is earned
